

Adult

Annual Income

Prediction

Michael Menjares

...

Project Description

The purpose of this project is to predict whether an adult individual would be classified into either annual income class: above \$50,000 or below \$50,000.

This would be based on factors such as education level, age, gender, occupation, etc.

\$50k

Adult Income Dataset

- The dataset is hosted on [kaggle.com](https://www.kaggle.com/datasets/adult/adult-income-dataset) but is originally from the 1994 US Census database and was extracted by Barry Becker.
- There are 14 columns of demographic features for predicting the income outcome of either '>50K' or '<=50K'
- The dataset contains about 49,000 entries

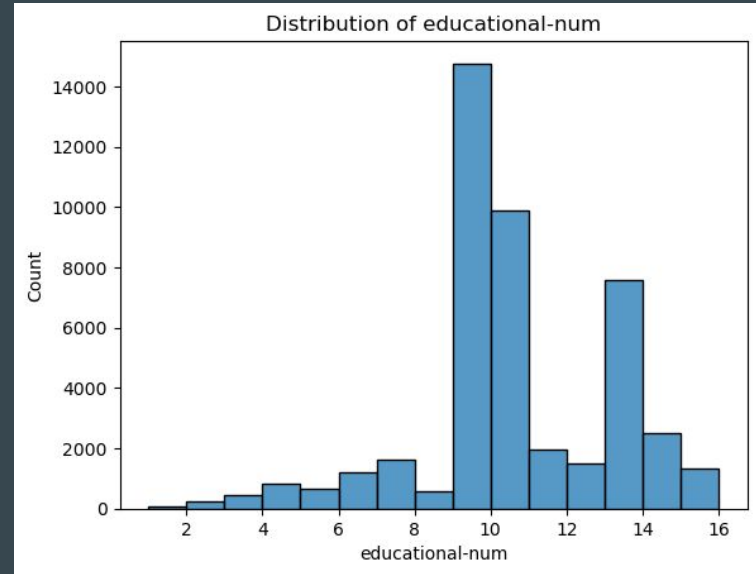

Age	Workclass	Final Weight	Education	Education-Num
Marital Status	Occupation	Relationship	Race	Gender
Capital-Gain	Capital-Loss	Hours-per-week	Native-Country	Income

Stakeholders

The stakeholders can be:

- historians, considering the age of the dataset
- non-profit or local organizations that want to know factors affecting lowering income communities
- government agencies to track economic trends
- business to learn who to cater their products to

Recommendations

I would like to see a current dataset to compare changes since the last 30 years

I would also like to recommend more attention to the factors that may lead to a lower income to find patterns to assist lower income areas
